

A useful monitor belongs in the top-left. Almost nothing is there.

Models fail in both directions: paging on everything, or on nothing at all.

Bars are Wilson 95% intervals. Hit rate is a census of all 12 milestone-carrying attack windows; false-page rate is a uniform sample of the matched benign control (n=12-36 per model; n=1,280 for the rule baselines). sev_threshold reads ground-truth severity: an upper bound, not a deployable detector.
